Barbara Ann Karmanos Cancer Institute, Wayne State University

1. Background

Karmanos Cancer Institute is an NCI designated Comprehensive Cancer Center and a Quality Oncology Practice Initiative (QOPI) certified site. In preparation for our QOPI re-certification we recognized we could apply those standards to enhance documentation and communication of drug accountability for our research patients. There was a need for more robust, real time documentation of drug compliance that could be standard for all clinical trial patients. We created and implemented the Management of Oral Investigational Drug (OID) policy, workflow, and nursing documentation aid that met the needs of the hospital requirements and research standards. This included compliance, patient education, return visit instructions, clinic contact, and specific dosing instructions.

2. Goals

Primary goals in order to meet QOPI standards and research objectives:

- Monitor patient adherence to OID administered outside of the health care setting at clinically meaningful intervals
- Ensure documentation of dosing, education, and compliance is available in the electronic health record (EHR)
- Standardization of OID accountability across all Multidisciplinary Team (MDT) services
- Address and limit discrepancies between OID dispensed and OID returned to improve data accuracy

3. Solutions and Methods

Methods:

- Developed a working group consisting of Research Nurses (RN) and Study Coordinators (SC) to ensure the process met all needs
- Institutional standards, QOPI, and research requirements were utilized when creating the policy and workflow
- Accountability is performed at every study visit, uploaded in the EHR using the nursing documentation aid, and is completed independent of sponsor requirements
- Standardized pill diary templates were created for use when not provided by the sponsor
- New process was piloted for one month (approximately 100 patient visits) to identify potential issues
- Process was amended based on pilot experience, finalized, and formally implemented across all MDTs

4. Outcomes

Standardizing this process among patients receiving OID has created a notable positive effect on the patient experience, compliance, data quality, and documentation. This policy and workflow guide the RN in a conversation with the patient and clinician to review compliance and enhance patient safety. It enables the RN to clarify discrepancies between the diary and pill count and identify patient dosing errors contemporaneously. OID dosing is documented more frequently and enables timely data entry and query resolution. The development of the OID policy, workflow, and nursing documentation aid ensures consistency across all MDTs. Availability of the documentation in the EHR improves communication among all clinical and research staff.

5. Lessons Learned

We have observed an improvement in patient compliance and expectation when patients are mindful that their dosing will be reviewed at every study visit. In turn, patients are empowered to become active participants in their own care. This frequent interaction has strengthened the rapport between patient and staff. The future direction of our institution is to utilize a comprehensive electronic medical record (EMR). This process can be easily modified and incorporated into the EMR.

We may not be able to stop the dog from eating the pill diary, but this process has provided us with documentation of compliance that we otherwise would not have.
